The multivariate analysis suggests that exposure to radiation was not the explanation for the increase in lung cancer mortality since the coefficient for exposure to radiation was not significantly different from 1. As discussed above, uranium is both a heavy metal and a low-specific-activity radioactive element. Further, other potential exposures including vanadium and thorium could have caused the increased cases of lymphoid malignancy.

However, in doing so, they created a health hazard that has become very misunderstood. Apart from the increases in respiratory cancer and violent deaths, the only other statistically significant finding was a reduced risk of death from major cardiovascular-renal disease among uranium miners, consistent with the expected healthy-worker effect see later discussion. These include the post-conflict psychological and social effects on human populations. The milling process crushes the ore and then leaches uranium from the ore with sulfuric acid or alkaline carbonates du Preez, Army: Technical Report". As stated before, DU is only mildly radioactive.
